LONDON, Sept 25: The British government said today that it would launch a review of the country's nuclear power policy, following a series of safety problems at the country's nuclear power stations.

The government said it would review the current nuclear power policy and consider whether it is still the best option for the country's energy needs.

The review will be led by the Department of Energy and Climate Change, which will consider the second phase of nuclear power stations in the country after the Supreme Court's decision.

The review will also consider the possibility of extending the life of nuclear power stations beyond their current 40-year limit.

The government said it would consult on the review's terms of reference later this year.

The announcement comes after a series of safety problems at nuclear power stations, including the partial loss of coolant at the closure of the Hinkley Point C nuclear power station in Somerset.

The government has previously said it would not support any new nuclear power stations in the UK following the closure of the Sellafield nuclear power station in 2015.

The British government has also been under pressure from opposition parties to review its nuclear power policy, with some calling for a complete phase out of nuclear power stations.

The government said the review would be completed by the end of the year and would be published in the spring of 2016.
